

CLAIMS

1. A pair of press-connecting pliers for pins on electric communication terminals, said press-connecting pliers are provided on the front and rear sides thereof with three kinds
5 of press-connecting grooves with different specifications, one of said sides is formed thereon a first press-connecting groove and a second press-connecting groove, while the other of said sides is formed thereon a third press-connecting groove in opposition to said second press-connecting groove; a left and
10 a right side of said press-connecting pliers are formed thereon two terminal holding seats respectively from said first press-connecting groove, said second press-connecting groove and said third press-connecting groove, thereby said two terminal holding seats at least are adapted for simultaneously doing
15 press connecting on electric communication terminals of three different types.

2. The pair of press-connecting pliers for pins on electric communication terminals as defined in claim 1, wherein said press-connecting pliers has a main plate used as a main body,
20 said main plate is provided thereon with two handles, and has therein two press-connecting sheets, one of said press-connecting sheets is formed thereon a first press-connecting die-block and a second press-connecting die-block, another of said press-connecting sheets is formed thereon a third press-
25 connecting die-block in opposition to said second press-

connecting die-block, to thereby form with said main plate a first press-connecting groove, a second press-connecting groove and a third press-connecting groove, in this mode, said press-connecting pliers has on said front and rear sides thereof said
5 three kinds of press-connecting grooves of different specifications, and thus said press-connecting pliers are adapted for simultaneously doing press connecting on electric communication terminals of three different types.

3. The pair of press-connecting pliers for pins on electric
10 communication terminals as defined in claim 2, wherein said handles are provided on the upper ends thereof with waving pieces, said waving pieces are connected with said two press-connecting sheets and is provided at two lateral sides respectively of said waving pieces with two pusher elements, said pusher elements are
15 slipped thereover with two elastic elements, said pusher elements and said elastic elements provided in said main plate; so that when said handles are held and pressed, said press-connecting sheets are pushed uniformly upwardly, and when said handles are released, said handles restore their proper
20 positions by restoring forces of said elastic elements.

4. The pair of press-connecting pliers for pins on electric communication terminals as defined in claim 2, wherein said press-connecting sheets are provided therebetween with a spacing piece, said spacing piece is provided with a stop piece
25 in alignment by position with said first press-connecting

groove.

5. The pair of press-connecting pliers for pins on electric communication terminals as defined in claim 2, wherein one side of said handles is provided with a wire peeling-knife, a push
5 block is provided on one side of said peeling knife; said push block is provided thereon with a groove facing to said peeling knife, and is provided on a rear end thereof with a spring abutting on a fixing element provided between said two handles, in order that said push block displaces axially in said fixing
10 element by action of said spring; hence said peeling knife is adapted for cutting and peeling electric communication wires.
